PROJECT SUMMARY

Maharashtra Unemployment Analysis

Project ID: C2C-IN015
Project Category: Social Research / Employment Analytics & Data Analysis
Assigned Team: C2C Data & Business Analyst Team
Tools Used: Microsoft Excel Google Docs
Primary Data Source: Periodic Labour Force Survey (PLFS) Annual Report 2025

---

1. Project Overview

The Maharashtra Unemployment Analysis project focuses on understanding the employment and unemployment situation in Maharashtra. The main purpose of this study is to examine unemployment among young people, educated individuals, and job seekers, while also understanding differences between rural and urban areas and male and female employment patterns.

The project uses official employment data from the Periodic Labour Force Survey (PLFS) Annual Report 2025 published by the Ministry of Statistics and Programme Implementation (MoSPI), Government of India.

Microsoft Excel was used to organize and analyse the data, while Power BI was used to create visual dashboards for presenting important findings.

2. Objectives

The key objectives of this project are:

- To understand the overall unemployment situation in Maharashtra.
- To study unemployment among youth aged 15–29 years.
- To compare rural and urban unemployment rates.
- To analyse differences in male and female unemployment.
- To understand labour force participation and worker population indicators.
- To examine education-related employment patterns.
- To identify possible challenges faced by students and fresh graduates.
- To suggest practical recommendations for skill development and employment readiness.

3. Key Findings

The analysis of PLFS 2025 data highlights the following findings:

Indicator	Maharashtra
Overall Unemployment Rate (15+)	2.4%
Youth Unemployment Rate (15–29)	7.7%
Labour Force Participation Rate (15+)	59.5%
Worker Population Ratio (15+)	58.0%
Rural Unemployment Rate (15+)	1.6%
Urban Unemployment Rate (15+)	3.5%

Youth unemployment: The unemployment rate among Maharashtra's youth aged 15–29 years was 7.7%, showing that youth employment remains an important area of concern.

Rural and urban difference: The overall unemployment rate was higher in urban areas (3.5%) than in rural areas (1.6%).

Gender comparison: For youth aged 15–29, the unemployment rate was 7.6% among males and 7.9% among females.

National comparison: Maharashtra's overall unemployment rate (2.4%) was lower than the all-India rate (3.1%). Its youth unemployment rate (7.7%) was also lower than the all-India rate (9.9%).

4. Data Analysis and Dashboards

The project data was organized and analysed using Microsoft Excel. Power BI was used to present the findings through visual dashboards.

The dashboards cover three major areas:

1. **Overall Employment Overview:** Important indicators such as unemployment rate, youth unemployment, LFPR and WPR, along with Maharashtra and India comparisons.
2. **Youth and Education Analysis:** Youth unemployment, gender comparison, rural and urban differences, and education-related indicators.

3. **Employment and Industry Analysis:** Employment status and the distribution of workers across different industry categories.

These dashboards make the information easier to understand and help communicate the major findings.

5. Challenges Identified

The project highlights several areas that require attention:

- Young people may face difficulties in finding suitable employment.
- Fresh graduates may need more practical and job-oriented skills.
- Rural and urban areas can have different employment opportunities and challenges.
- Women may face additional barriers to entering and continuing employment.
- There can be a gap between educational qualifications and the skills expected by employers.

These are areas for further investigation and possible intervention. The available PLFS data does not directly measure every one of these challenges.

6. Recommendations for Analytics Career Connect (ACC)

Based on the project findings, the following initiatives are recommended:

- Provide practical training in Excel, SQL, Power BI, Python and other job-relevant tools.
- Introduce live projects and practical assignments.
- Conduct interview preparation and resume-building sessions.
- Organize career guidance sessions for students and fresh graduates.
- Encourage industry connections and internship opportunities.
- Improve access to digital learning and career resources for students from rural areas.
- Support women's participation through accessible training and career guidance.

7. Limitations of the Study

This project mainly uses the PLFS Annual Report 2025 as its primary quantitative source.

District-level unemployment figures and direct skill-gap measurements were not available in the collected dataset. Education-related indicators are not all specific to youth, and industry-wise worker distribution represents existing workers rather than job vacancies.

The 2025 PLFS survey uses a revised sampling design and a January–December reference period. Therefore, comparisons with earlier annual PLFS reports should be made carefully.

8. Conclusion

The analysis shows that Maharashtra performs better than the all-India average on the overall and youth unemployment indicators covered in this study. However, youth unemployment, urban employment challenges and gender differences remain important areas to examine.

The project demonstrates how official employment data can be organized, analysed and presented through Excel and Power BI. The findings can help Analytics Career Connect understand employment-related challenges and plan practical initiatives focused on skill development, career readiness and employability.
